Computer Based Training (CBT) Observer MKIII Version 3.15+ Code

The application has been developed in Power Point and includes a Power Point Viewer; the package is relatively compact and will run on Windows XP, Vista or Windows 7. Users can be provided with telephone support (billable) if required and additional training is available on application to the factory.

The Observer CBT package has been developed by a specialist in airborne mission systems and pre-release auditing has been conducted in conjunction with operation air support units. As such Honeywell believe the package is well tailored to meet the training needs of the users as well as reflecting the capabilities of the Observer System.

Honeywell is pleased to offer a CBT package for the **Observer MKIII Mission System**; the package is aimed at Police, Air Ambulance, Military and Search and Rescue operators who operate with multiple crews who require initial and recursive training on the system to maximise role effectiveness and efficient use of the mission platform.

Cost Benefits:

- Operating cost savings through crew familiarisation prior to on-platform training.
- Training costs reduced through an on base system which is accessible at all times.
- Train the Trainer possible to reduce recursive training time and costs for new staff.

Training Benefits:

- Training modules are all linked to the relevant screens on Observer.
- Pages provide help on specific functions and key options where applicable.
- Quick links to most used features in the system to help efficient use.
- Allow experimentation with less used features to expand system effectiveness.
- Can be used in classroom and self study modes to promote effective learning.
- Can if requested be tailored (at cost) to specific user needs and operations.
- Pilots Guide and Operating Manual included and linked through to the package.
